

# KYOCOUNT 3.0

Advanced Print Control

## KYOcount 3.0

All too often, system administrators wind up being trouble shooters for an endless series of minor problems – an annoying waste of their valuable time. With new KYOcount 3.0 from Kyocera, the administrator's day runs more smoothly and the entire system operates more efficiently and professionally – improving productivity across the organisation. KYOcount software enables the administration and management of all networked printers and multifunctional devices (MFPs). The software generates clearly structured reports, keeping administrators up-to-date on system status at all times. The KYOcount solution is designed to work with Kyocera devices but will also integrate other manufacturers' systems, using industry-standard SNMP.

KYOcount 3.0 collects data via Simple Network Management Protocol (SNMP) from all devices in the network.

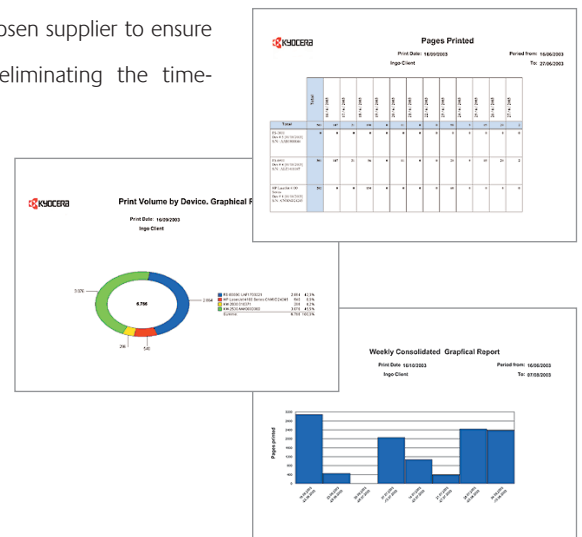

## The efficient way to control and monitor printing

With KYOcount 3.0, administrators no longer need to invest time in manually recording and documenting the devices in use and their counter readings. The counter data is presented automatically in graphical bar or pie chart format, allowing easy integration into customer reports for example. The ability to export to CSV format, and support of the industry standard XML, means that data is also available to other software applications. KYOcount 3.0 provides precise information on how many pages are printed in a defined period of time - e.g. within one month - whether a paper jam is blocking the system, if paper needs to be refilled or a paper drawer is open. This degree of automation significantly improves service levels, prevents bottle-necks and streamlines system operation. As a further example, automatic e-mail message alerts can pre-warn users when toner is running low, giving them plenty of time to replace it before the situation becomes critical.

To make the IT administrator's life even simpler, KYOcount can also send data to a chosen supplier to ensure accurate billing for machines which are on a pay by use contract, thereby eliminating the time-consuming task of manual collection.

A free, easy-to-install, 90-day trial version offering unlimited functionality is available from Kyocera Channel Partners. Users can continue to take advantage of all the product features after the trial period by purchasing and entering a licence code.

Whether for a 90-day trial to get print analysis, a full version to help manage your output devices or fully connected to your office equipment supplier, KYOcount is the cost effective tool to help IT administrators ensure their network runs smoothly.
